Exercises

Summary

Build a system based on previous work continuing to use our H2 in-memory database for storage following the lecture notes. This time, use the MapSqlParameterSource to customize any and all data you insert, then retrieve all Students you've inserted for display!

Step 1

Follow through the lecture and build the demoed code as ex51_jdbcTemplateContinued. We will need this next class one more time, so be sure to do it! Preferably, NOW, while you can get help!!! Don't drown here! Our next exercise, building on this one, is one of the most important for the course!

Honestly, don't you want to see it all working on your own machine anyway?! 😊

When you get it done, hand in a screenshot of your home page with your name already added to the studentList at the top, and a bunch of other names added for good measure too! Style, style, style!!!
